

# The Binocular Sky

No. 130  
October 2022

# Newsletter

## Introduction

Welcome to October's **Binocular Sky** Newsletter.

At last the "observing season proper" has arrived in northern temperate latitudes; the sky is darkening reasonably early and we are starting to see more public stargazing evenings.

Autumn is "**Milky Way** season", and binoculars really come into their own here. If you have access to the little Galilean-type widefield binoculars, such as the Vixen 2.1x42, give them a try. I find them to be truly delightful on the Milky Way.

In the Solar System, the increasing darkness means that we have more opportunity for lunar occultations. **Vesta** is low in the south and the binocular planets (ice-giants **Uranus** and **Neptune**) are now both nicely placed for observation.

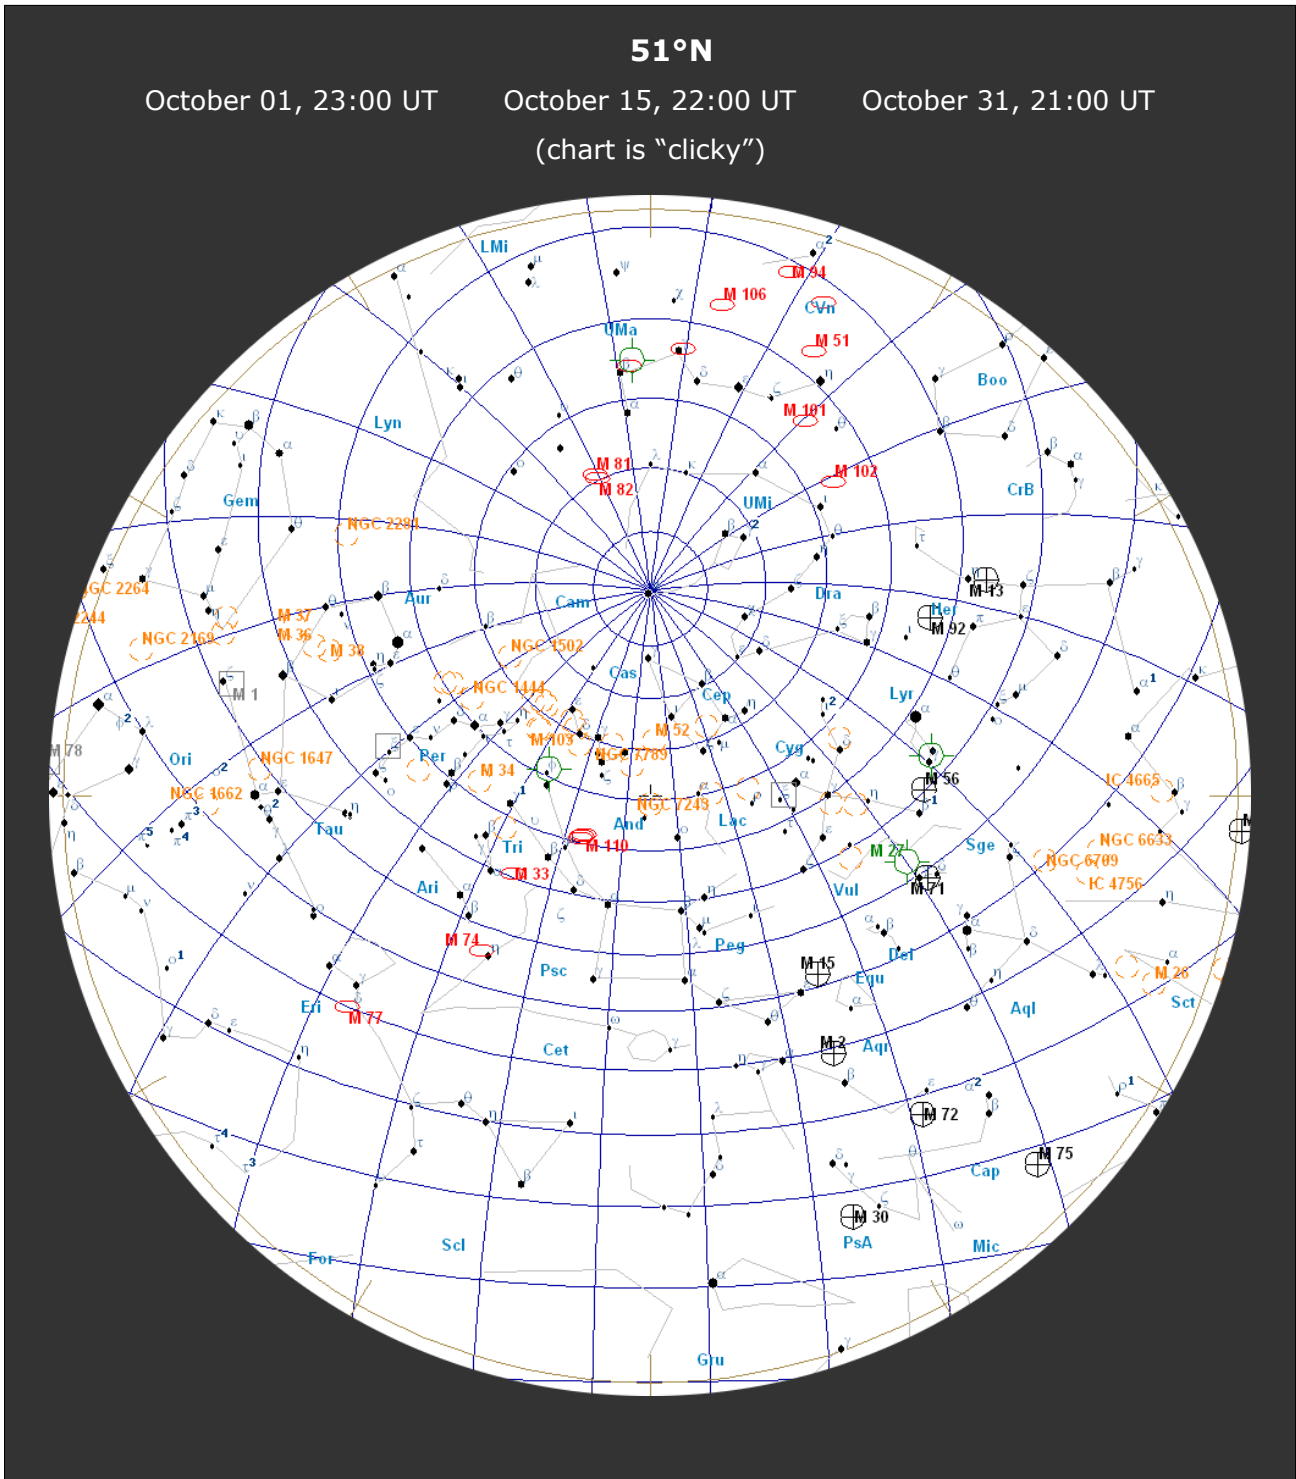

It's always tricky predicting comets, but **C/2022 E3 (ZTF)** appears to be brightening more rapidly than expected, and may become a binocular object by the end of the year; watch this space.

If you would like to receive the newsletter automatically each month, please complete and submit the [subscription form](#). You can get "between the newsletters" alerts, etc. via  and .

## The Deep Sky

*([Hyperlinks](#) will take you to finder charts and more information on the objects.)*

As the sky darkens at twilight, the Milky Way, always a pleasure to scan with binoculars of any size, arches overhead. In the north are [NGC 457](#) (the

Owl Cluster) and [NGC 663](#) in Cassiopeia and the [Perseus Double Cluster](#), from which you can easily find [Stock 2](#) (the Muscleman Cluster). [Kemble's Cascade](#) and its "splash pool", [NGC 1502](#) are also conveniently placed. To the East of them lie [M34](#) in Perseus and the often-overlooked [NGC 752](#) in Andromeda. More open Clusters are visible in the southern sky in the region of Ophiuchus. These include [Melotte 186](#), [NGC 6633](#) and [M11](#), The Wild Duck Cluster, all of which are easily visible in 50mm binoculars. Rising in the north-east are the [Auriga clusters](#), [M36](#), [M37](#) and [M38](#) and, later, [M35](#) in Gemini. While you are looking at [M35](#), also see if you can identify two smaller open clusters, [NGC 2158](#), which is half a degree to the SE, and the slightly more difficult [IC 2157](#), which is a degree to the ESE. To the south of them, the [Pleiades](#) and [Hyades](#) make a welcome return to evening skies. Also look out for the nearby [NGC1647](#).

*Open (also called 'Galactic') Clusters are loosely packed groups of stars that are gravitationally bound together; they may contain from a few dozen to a few thousand stars which recently formed in the galactic disk.*

In November, the Milky Way is overhead in the mid-to-late evening. This means that those objects (globular clusters and galaxies) that are outside our galaxy are not as well placed for observation as they are when the Milky Way is low in the sky. The bright [M81](#) (Bode's Nebula) and [M82](#) (The Cigar Galaxy), are still relatively easy to observe, even in a 50mm binocular, and their altitude is such that you are unlikely to get neck-strain when you do so with straight-through binoculars. [M81](#) and [M82](#) can be used as a good demonstration of averted vision, especially in larger binoculars: if you have them both in the same field of view, you may see that the core of [M81](#) becomes more apparent if you look at [M82](#). [M51](#) (The Whirlpool) and [M101](#) are becoming much more difficult owing to their lower altitudes; if you wish to see them this month, you should look as soon as the sky is dark.

*Galaxies are gravitationally bound "island universes" of hundreds of billions of stars at enormous distances. The light that we see from [M31](#), for example, left that galaxy around the time our technology consisted of rocks, sticks and bones.*

Notable exceptions to the generalisation of galaxies being poorly placed on November evenings are some of those south of the galactic plane,

notably The Great Andromeda Galaxy, M31 and M33 (The Triangulum Galaxy). M31 in particular is very easily visible this month and is a naked eye object in moderately dark skies. It is large and bright enough to be able to withstand quite a lot of light pollution (making it available to urban observers). M33 has a low surface-brightness and benefits from lower magnification. This generally makes it easier to see in, say, a 10x50 binocular than in many "starter" telescopes. It is in November evenings that the Sculptor Galaxy, NGC 253, becomes observable before midnight, but you will need a good southern horizon for this.

Although the two Hercules globulars, M92 and the very impressive, and very easy to find, M13 are still observable, their altitude becomes less favourable as the month progresses. M15 and M2 are both better placed. This is also the best time of year to observe NGC 288 in the evening; as with NGC 253, a good southern horizon is essential.

*Globular clusters are tightly-bound, and hence approximately spherical, clusters of tens, or even hundreds, of thousands of stars that orbit in a halo around almost all large galaxies that have been observed.*

The easiest planetary nebula, M27 (the Dumbbell Nebula – also known as the Apple Core and the Diabolo) – is visible in the evening skies in even 30mm binoculars. The Helix Nebula, NGC 7293 is now about as well-placed as it gets for observation from Britain before midnight; you'll need a decent southern horizon.

*Planetary Nebulae are short-lived (a few tens of thousands of years) masses of gas and plasma that result from the death of some stars. They have nothing to do with planets, but get their name from the fact that, in early telescopes, they had the appearance of giant ghostly planets.*

## The Solar System

### The Moon

October 03    First Quarter  
 October 09    Full Moon  
 October 17    Last Quarter  
 October 25    New Moon

### Lunar Occultations

Data are for my location and may vary by several minutes for other UK locations. The phases are **(D)**isappearance, **(R)**eappearance and **(Gr)**aze; they are dark-limb events unless the Cusp Angle is negative.

Lunar Occultation October 2022 50.9°N 1.8°W							
Date	Time (UT)	Phase	Star	Spectral Type	Magnitude	Position Angle	Cusp Angle
Oct 11	03:38:38	R	HIP 9569	K0	6.5	244	79S
Oct 11	22:18:33	R	omi Ari	B9	5.8	275	69N
Oct 12	00:12:13	R	HIP 13069	K0	6.7	212	48S
Oct 12	04:05:02	R	HIP 13448	F5	6.3	266	78N
Oct 13	04:15:31	R	HIP17453	A0	6.1	272	74N
Oct 17	00:06:59	R	HIP 34735	K0	6.7	230	43S
Oct 17	03:09:30	R	HIP 35253	G7	6.5	289	78N
Oct 17	04:16:18	R	HIP 35494	G8	7.0	337	30N
Oct 17	23:14:36	R	4 Cnc	A1	6.3	290	83N

## Asteroids

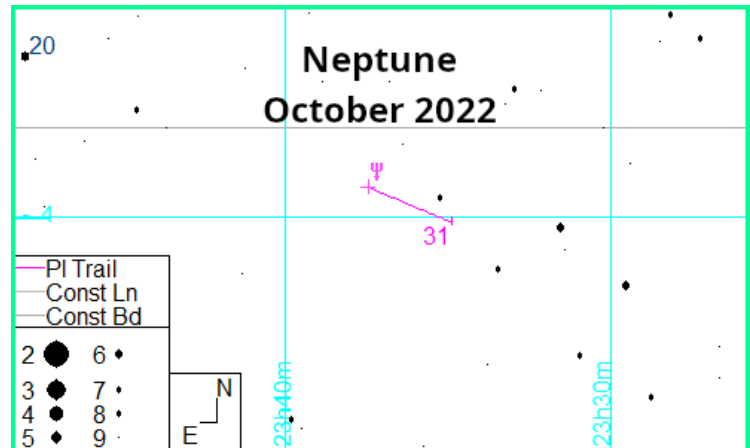

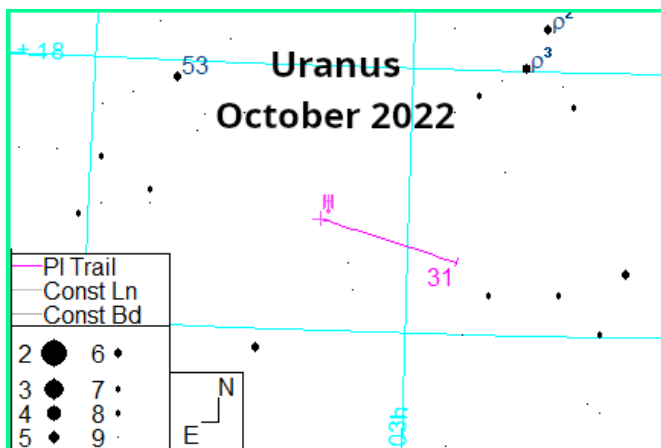

**Asteroid 4 (Vesta)** dims from mag +7.1 to +7.7 during the month. It lies between the **Helix Nebula (NGC 7293)** and the globular cluster **M30**.

(charts are "clicky")

## The Binocular Planets

**Uranus** (mag +5.7) is still best observed after midnight all month, and **Neptune** (mag +7.8), well before midnight. Use **p-3** and **53 Ari** as guides to Uranus, and **20 Psc** to locate Neptune.

## Public Outreach & Talks

If you find yourself at any of these, do come and introduce yourself or give me a virtual “wave”.

Dates are UT. Z indicates “Zoom”

Oct 3 <sup>rd</sup>	Blandford TC	<b>The Right Light at Night</b>
Oct 4 <sup>th</sup>	Vale of Allen PC	<b>The Right Light at Night</b>
Oct 5 <sup>th</sup>	Melbury Abbas PC	<b>The Right Light at Night</b>
Oct 6 <sup>th</sup>	Planet Shaftesbury	<b>The Right Light at Night</b>
Oct 10 <sup>th</sup>	<u><a href="#">Astronomy Ireland (Z)</a></u>	<b>Ten Ways the Universe Tries to Kill You</b>
Oct 11 <sup>th</sup>	East Knoyle PC	<b>The Right Light at Night</b>
Oct 12 <sup>th</sup>	Tarrant Monkton and Launceston PC	<b>The Right Light at Night</b>
Oct 13 <sup>th</sup>	Kingston Deverill PC	<b>The Right Light at Night</b>
Oct 14 <sup>th</sup>	<u><a href="#">Hampshire Astronomy Group</a></u>	<b>Two Eyes are Better than One</b>
Oct 19 <sup>th</sup>	Wimborne Green Festival	<b>The Right Light at Night</b>
Oct 22 <sup>nd</sup>	<u><a href="#">Penryn Community, Nature and Climate Conference</a></u>	<b>Responsible Outdoor Lighting Workshops</b>
Oct 26 <sup>th</sup>	<u><a href="#">Marshwood Farm Camping</a></u>	<b>Stargazing Evening</b>
Oct 27 <sup>th</sup>	Steeple Langford Parish Meeting	<b>The Right Light at Night and Stargazing Evening</b>

### Zoom/Webex Talks?

I regularly give talks, on *Binocular Astronomy* and numerous other astronomical topics. I’d be happy to do this – including locations anywhere in the world on Zoom or Webex – that is of interest.

**If you would like a talk for your society/group, [Click here for current talks](#).** For schools/scouts/guides, etc., I am a STEM Ambassador so there will be no fee.

The **Binocular Sky Newsletter** will always be free to anyone who wants it, but if you would like to support it, there are a number of options:

- Purchase one of my books, **[Binocular Astronomy](#)** or **[Discover the Night Sky through Binoculars](#)**.
- Buy equipment or books through an affiliate link in the newsletter or on <https://binocularsky.com>
- Make a small [PayPal](#) donation to [newsletter@binocularsky.com](mailto:newsletter@binocularsky.com)

Wishing you Clear Dark Skies,

**Steve Tonkin**
